Chocolate Sales Analysis using SQL

A Data Analysis Project

NAME: D. BHARATH

Role: Aspiring Data Analyst

Made with GAMMA

Project Overview ,Tools & Technologies

1

This project focuses on analyzing chocolate sales data using SQL.

The main objective is to extract useful insights from raw data by applying different SQL operations like filtering, grouping, and joining multiple tables.

The dataset includes information about: • Sales transactions
• Products
• Sales persons
• Locations

The analysis helps in understanding sales performance and trends.

2

• Excel – for initial data handling
• MySQL – for database management

Key SQL Concepts Used: • WHERE clause
• GROUP BY
• HAVING
• JOINs
• Aggregate Functions (SUM, COUNT, AVG)

Made with GAMMA

Limit to 1000 rows

```sql
SELECT * FROM chocolate_sales_analysis.people_data;
-- Select all people whose name starts with S.
SELECT * FROM people_data where `Sales Person` like "s%";
-- Fetch all records where country = 'hyderabad'.
SELECT * FROM people_data where Location="hyderabad";
-- Show the count of people in each country.
SELECT count(`sales Person`),location from people_data group by location;
-- Show countries having more than 2 people.
SELECT Location,count(team) from people_data group by Location having count(team)>2;
-- Show customers who have placed more than 3 orders.
SELECT p.`Sales person`,count(s.boxes) from people_data p join
shipments s on p.`sp id`= s. `sales Person` group by `Sales Person` having count(s.boxes)>3;
```

Made with GAMMA

```sql
SELECT * FROM chocolate_sales_analysis.products_info;
-- Find the product with the highest price.
SELECT product,`cost per Box` from products_info order by `Cost per Box` desc limit 1;
-- Calculate the average price for each product category.
SELECT p.product,round(avg(s.amount)) as avgPrice from products_info p join
shipments s on p.`Product ID`=s.product group by p.Product;
-- Join sales and products tables to show product name and total sales.
SELECT p.product,sum(s.Amount) as TotalSales from products_info p join
 shipments s on p.`Product ID`=s.product group by p.Product;
-- Join sales and people tables to show customer name and total orders.
SELECT p.`sales person`,sum(s.boxes) as TotalOrders from people_data p join
shipments s on p.`sp id`=s.`sales person` group by p.`sales person`;
```

Made with GAMMA

```sql
SELECT * FROM chocolate_sales_analysis.geo_info;
-- Find the top 3 highest selling products.
SELECT p.Product,s.boxes from products_info p join shipments s order by s.boxes desc limit 3;
-- Find the customer who spent the most money.
select p.`sales person`,s.amount from people_data p join shipments s order by s.amount desc limit 1;
-- Calculate total sales for each country.
SELECT P.Location,sum(s.amount) as `Total sales` from people_data p join shipments s on p.`SP ID`=s.`sales person` group by p.Location;
-- Calculate average sales per product.
 SELECT p.product, round(avg(s.amount),2) as avgSales from products_info p join
 shipments s on p.`Product ID`=s.product group by p.Product;
 -- Find the most popular product (maximum number of orders).
 SELECT p.product,max(s.boxes)as maxOrders from products_info p join
 shipments s on p.`product ID`=s.product  group by p.Product order by p.Product desc limit 1;
```

Made with GAMMA

```sql
SELECT * FROM chocolate_sales_analysis.shipments;
-- Calculate the total sales amount from the sales table.
SELECT sum(amount) as `total Sales` from shipments;
-- Count the total number of orders in the sales table.
SELECT count(boxes) as orders from shipments;
-- Calculate total sales amount for each product.
SELECT product,sum(amount) as totalAmount from shipments group by product;
-- Count total number of orders for each customer.
SELECT product,count(boxes) as orders from shipments group by product;
-- Show products where total sales amount is greater than 500.
SELECT Product,sum(amount) as `total Sales` from shipments group by Product having sum(Amount)>500;
```

Made with GAMMA

SELECT * FROM LINKEDIN WHERE `PEOPLESAY` ="THANKYOU :)"
